MANAGEMENT FORUM

Our Carbon Equation

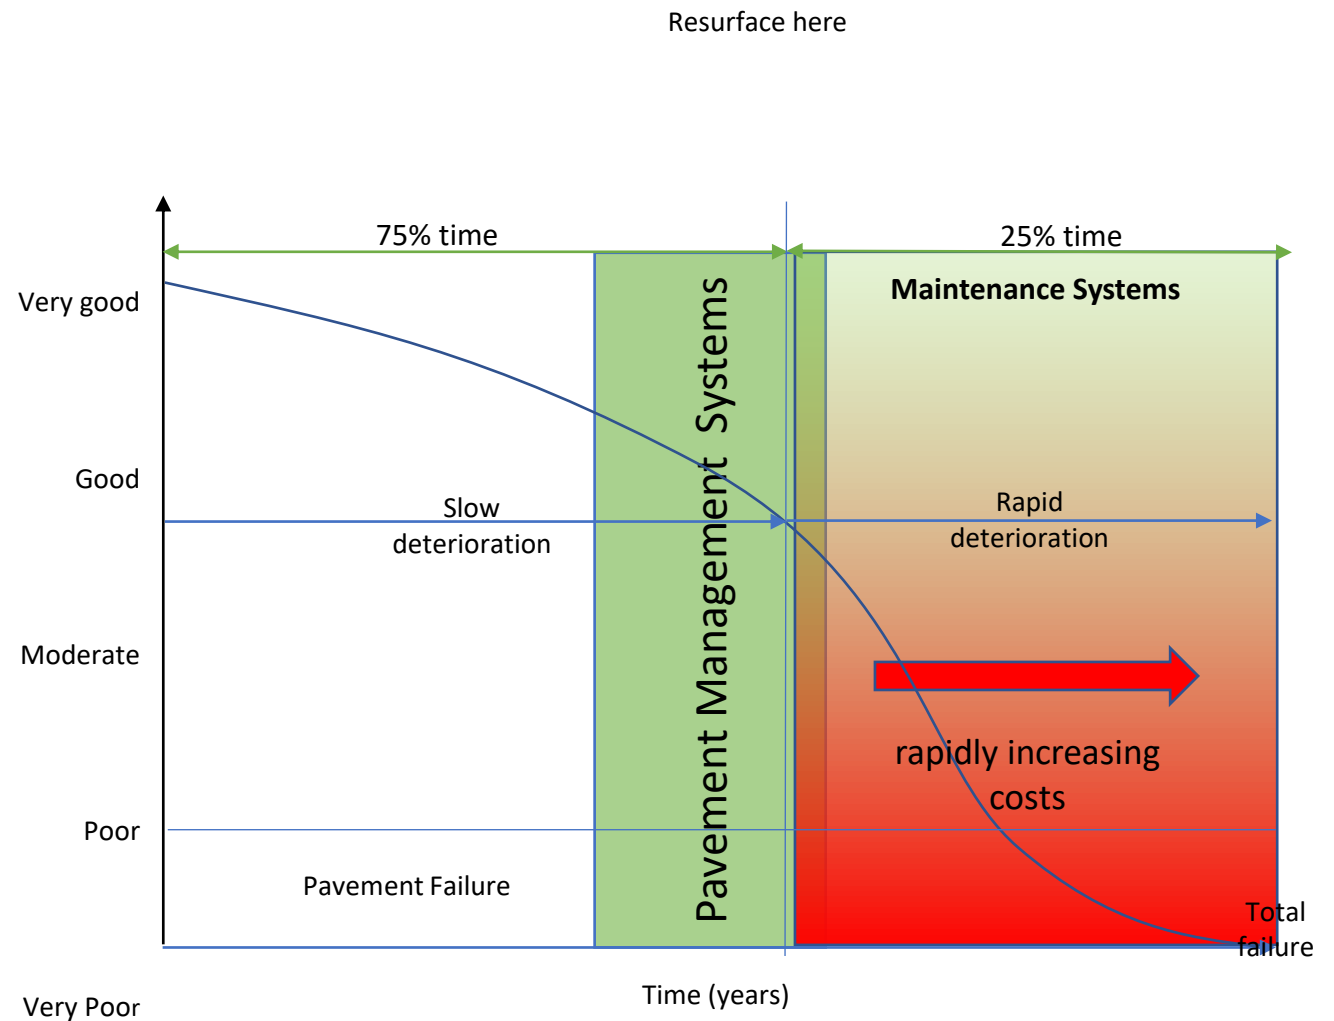

To maintain or rehabilitate? That is the question

Stephen Wormald | GeoSolve Limited

To Maintain or Manage

- Maintenance Management Systems:
 - **Reactive:** measures are taken based mainly on the surface condition monitoring results (=symptoms)
- Pavement Management Systems
 - **Proactive:** Monitoring is made to detect the root causes of the surface condition (=diagnostics) and measures are taken before damages appear

Maintenance or Management

Road Pavement Deterioration Vs Time

Our Carbon Equation

Profile and Visual data = High Quality and Sampling Rate

Our Carbon Equation

What's Needed to Manage Pavements?

Structural Data & Models

What's Needed to Manage Pavements?

Structural Data & Models

Falling Weight Deflectometer

- Typical Network Sampling Frequency
 - 200m – 400m is this sufficient?
 - every year, 2 or 3?
- Whole Network surveys?

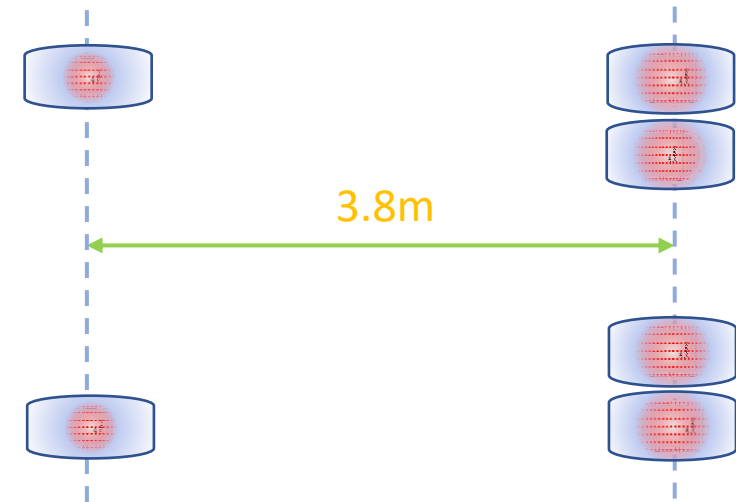

Traffic Speed Deflectometer

- Summer months

Traditional Structural Models are too standard

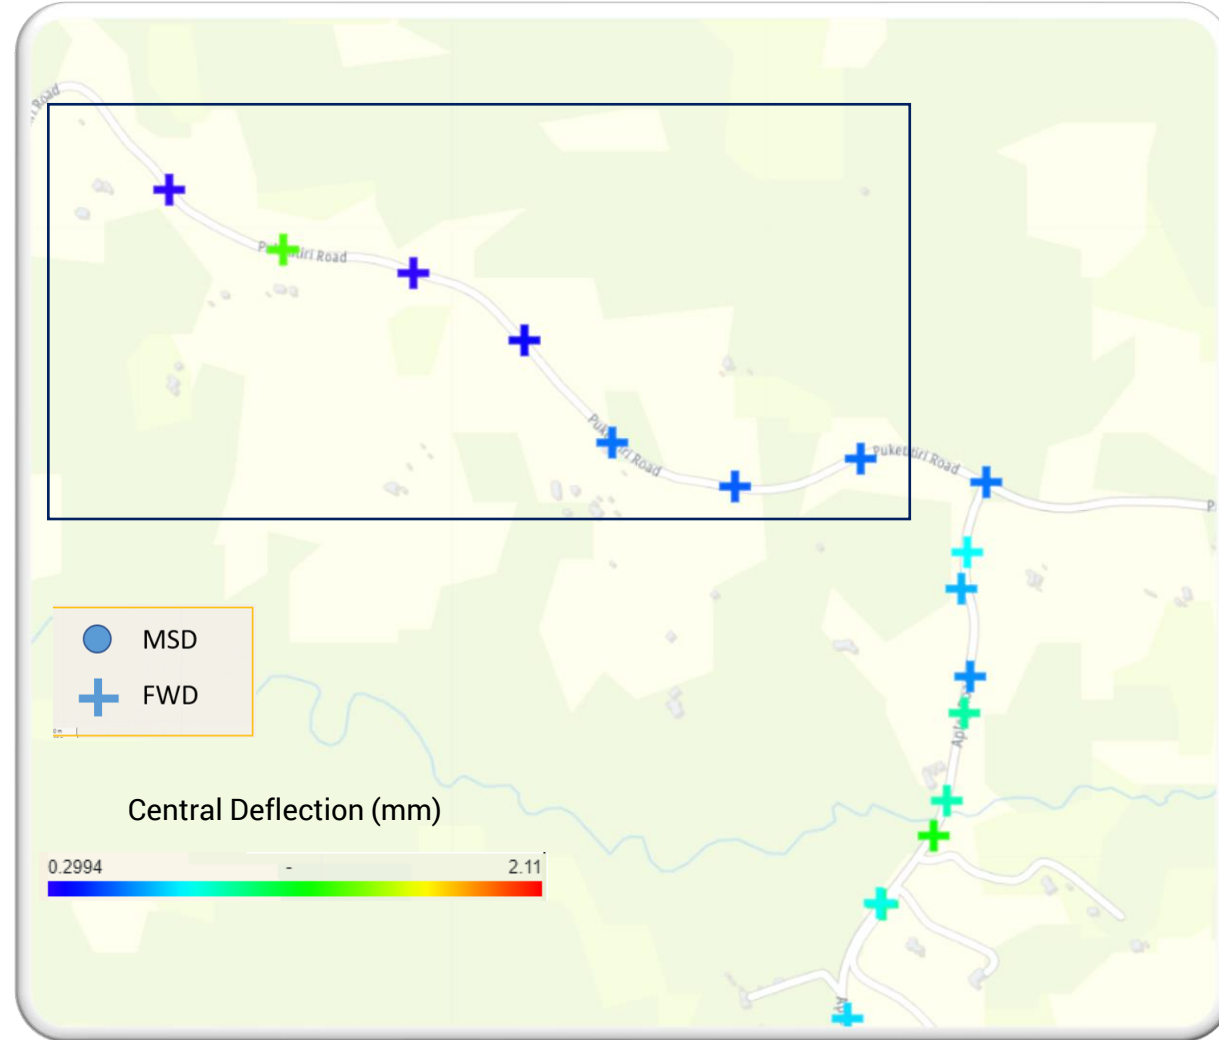

Multi Speed Deflectometer

- Used on most roads
- Structural surveys at traffic speed
- 1 or 2 wheel paths
- Surveying in any weather condition any time of year
- Identification weak section for further investigation
- Network surveys of 25 RCA

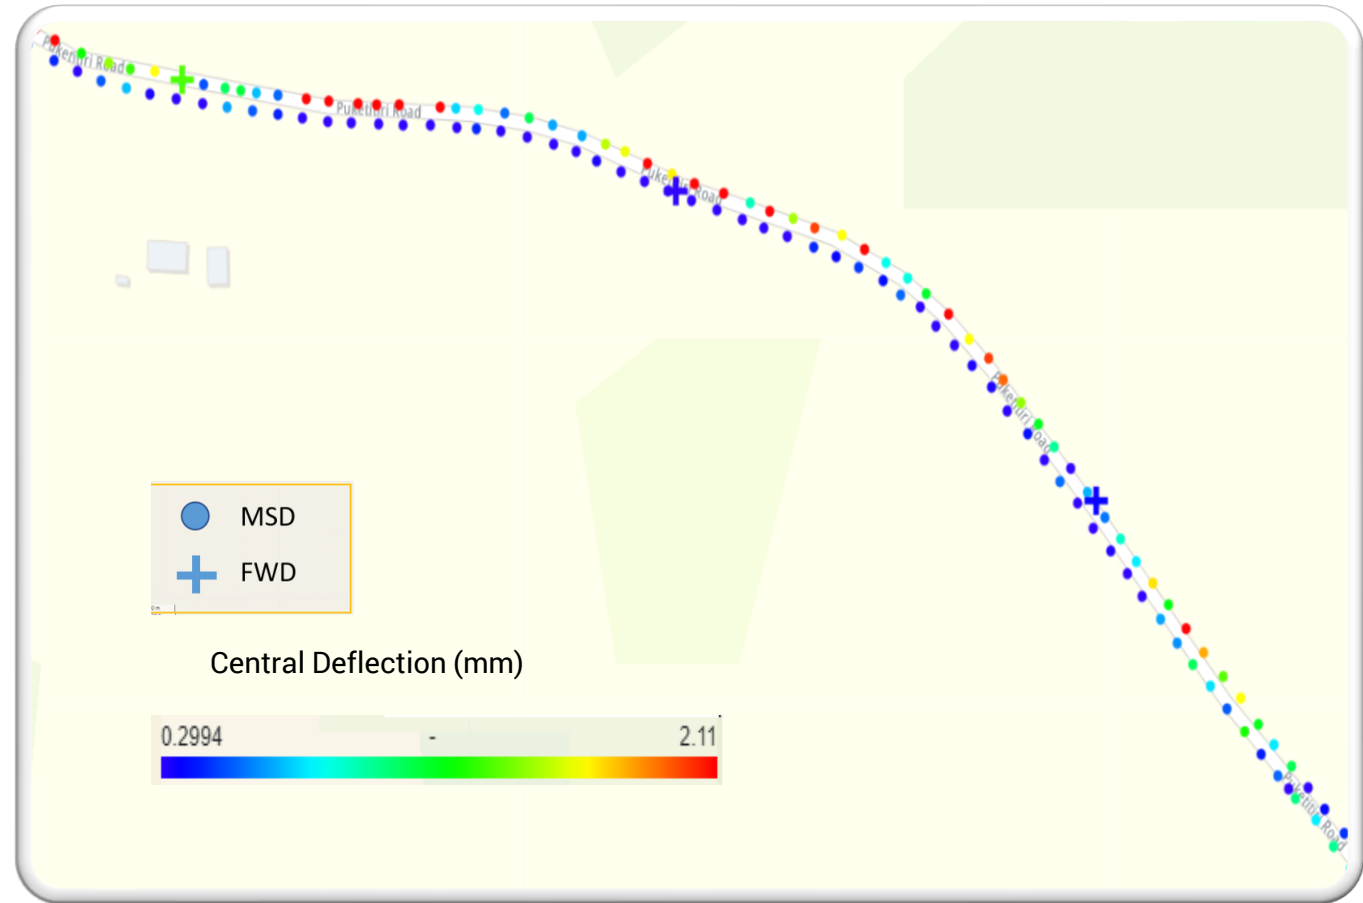

Hastings – Puketitiri Rd

- FWD Central Deflection (d0) Results from Network Level Survey in October 2014
- 200m spacings staggered across L1 and R1 Lanes

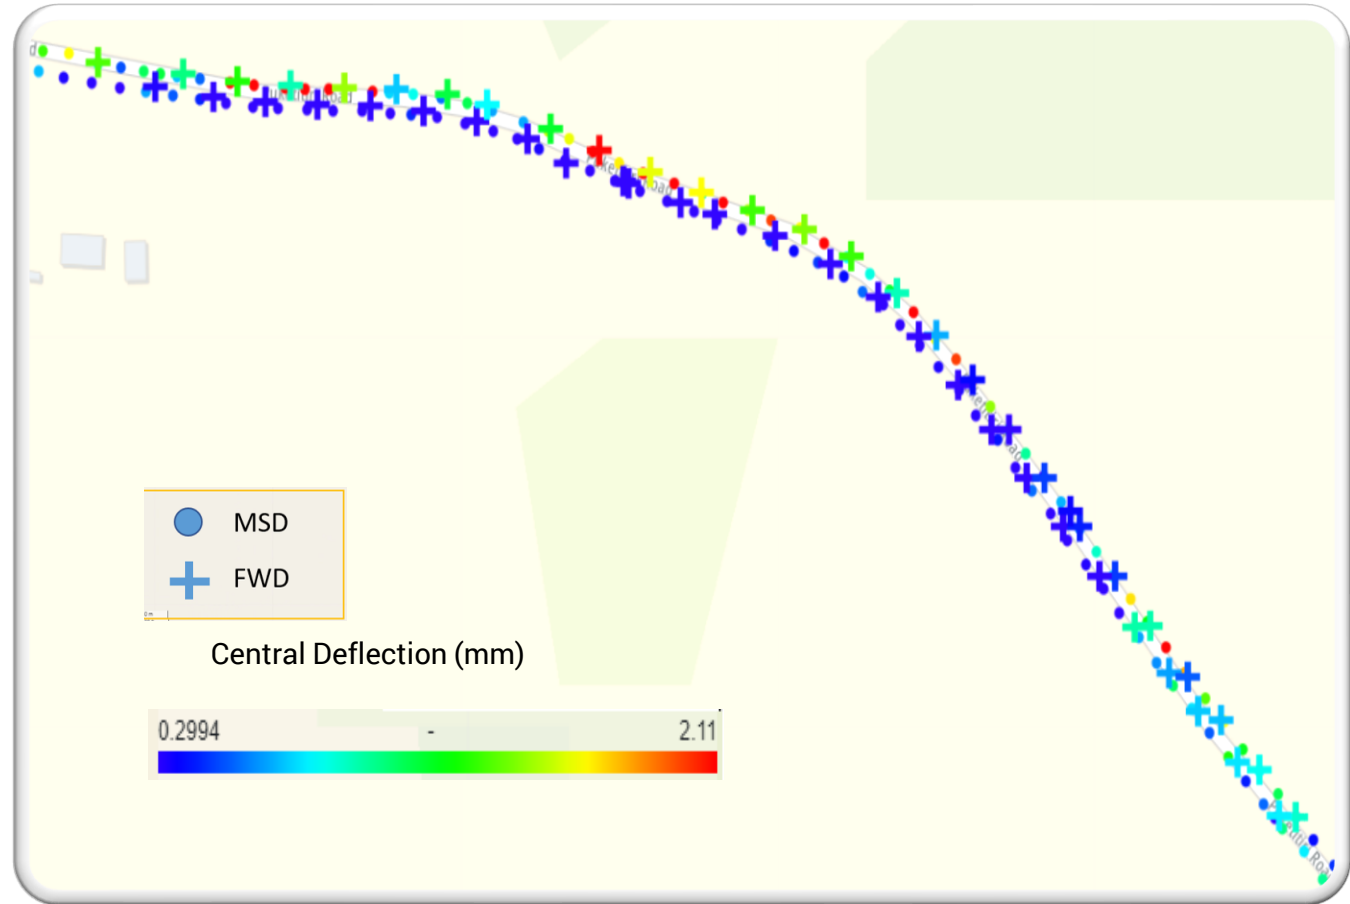

Hastings – Puketitiri Rd

- MSD d0 Results from Network Level Survey in August 2021
- **PLUS** FWD Central Deflection (d0) Results from Network Level Survey in October 2014

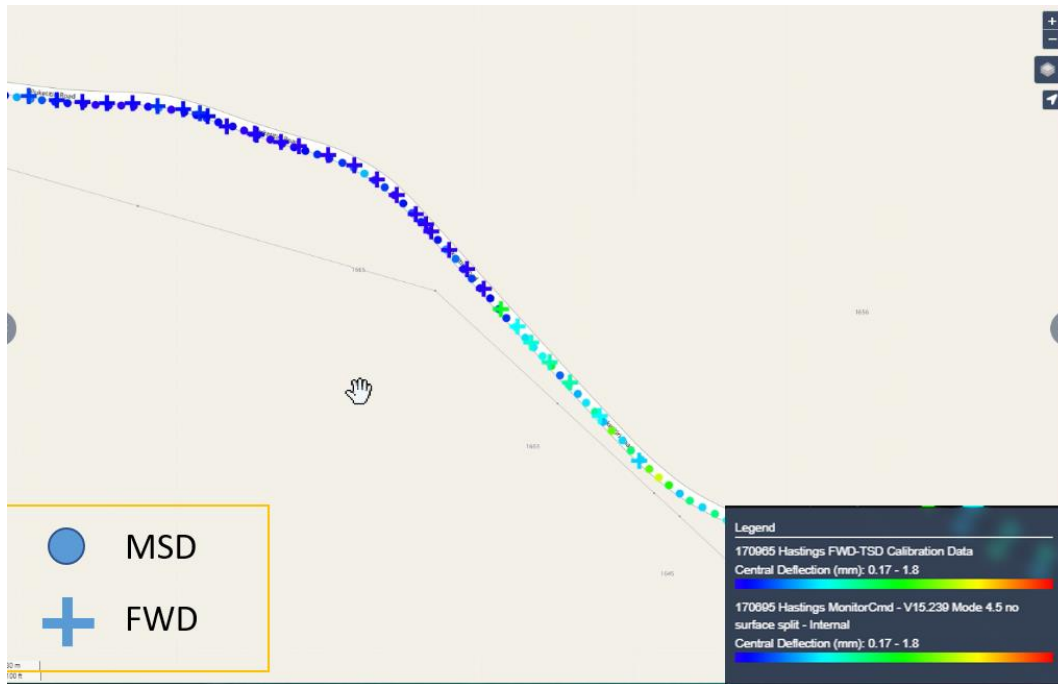

Hastings – Puketitiri Rd

- FWD Central Deflection Results from Project Level Testing in December 2021 (20m spacings staggered across L1 and R1 Lanes)
- PLUS MSD d0 Results from Network Level Survey in August 2021

Hastings – Puketitiri Rd

- West Bound

- East Bound

MSD & FWD improving knowledge of the pavement

What's Needed to Manage Pavements?

Models

Simpler said than done!

Materials

Construction Processes

Maintenance Practices

Loading

Environment

- We believe in the perfect pavement
- We simplify pavement
- Models are too generic

Traditional Pavement Models

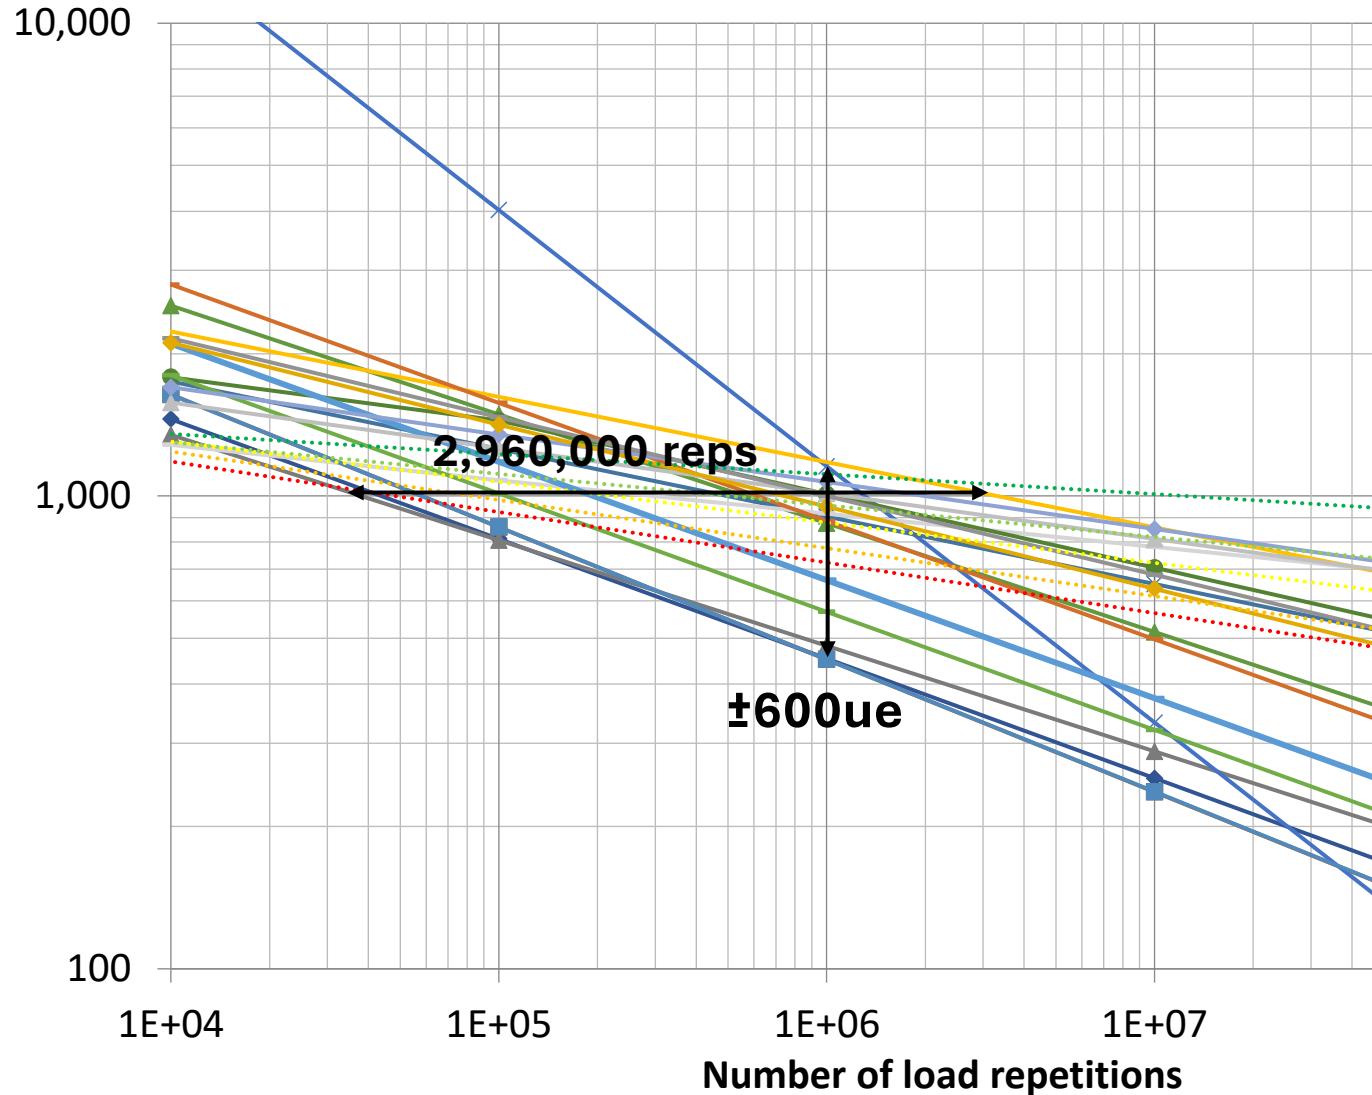

Permissible Vertical Microstrain at the Top of the Subgrade

Our Carbon Equation

Traditional Pavement Models

Permissible Vertical Microstrain at the Top of the Subgrade

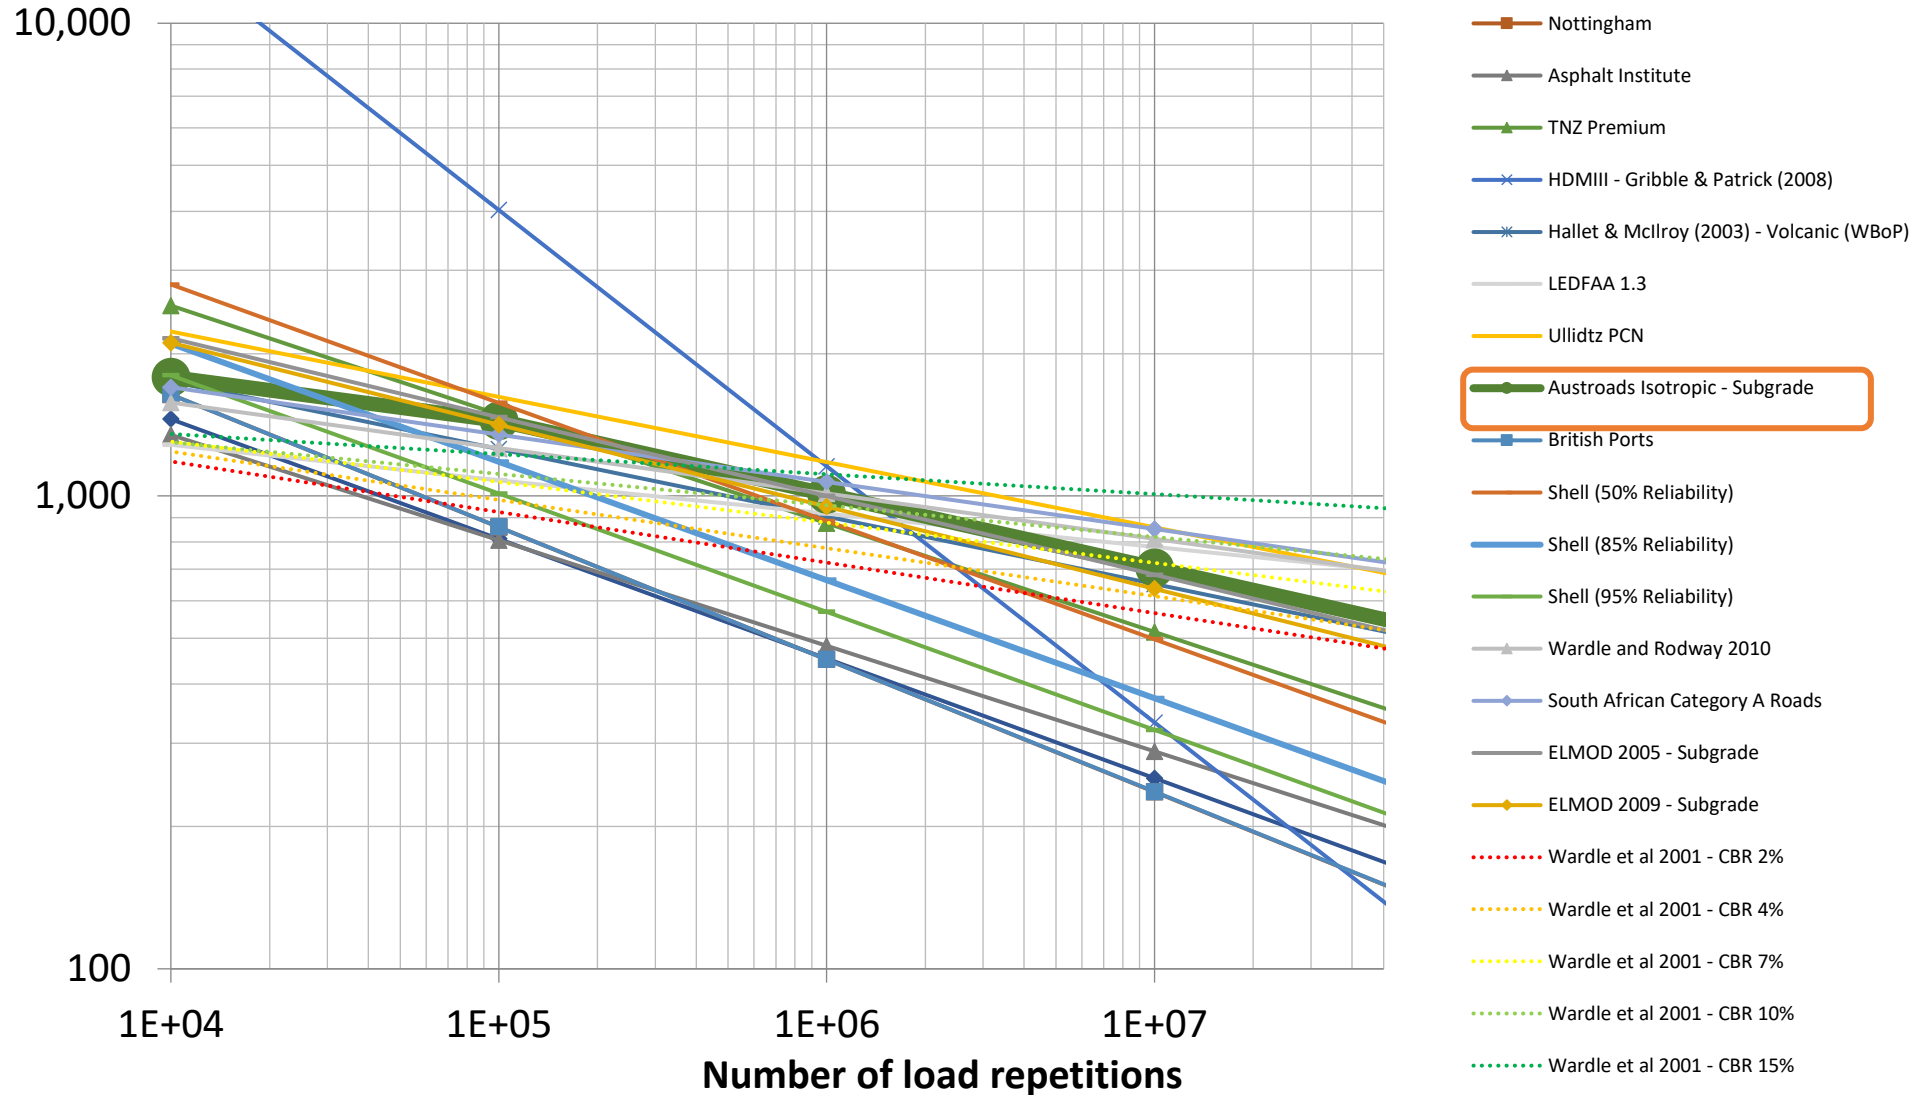

- TRRL
- Nottingham
- ▲— Asphalt Institute
- ▲— TNZ Premium
- ×— HDMIII - Gribble & Patrick (2008)
- *— Hallet & McIlroy (2003) - Volcanic (WBoP)
- LEDFAA 1.3
- Ullidtz PCN
- Austroads Isotropic - Subgrade
- British Ports
- Shell (50% Reliability)
- Shell (85% Reliability)
- Shell (95% Reliability)
- ▲— Wardle and Rodway 2010
- South African Category A Roads
- ELMOD 2005 - Subgrade
- ELMOD 2009 - Subgrade
- ... Wardle et al 2001 - CBR 2%
- ... Wardle et al 2001 - CBR 4%
- ... Wardle et al 2001 - CBR 7%
- ... Wardle et al 2001 - CBR 10%
- ... Wardle et al 2001 - CBR 15%

Our Carbon Equation

Traditional Pavement Models

Permissible Vertical Microstrain at the Top of the Subgrade

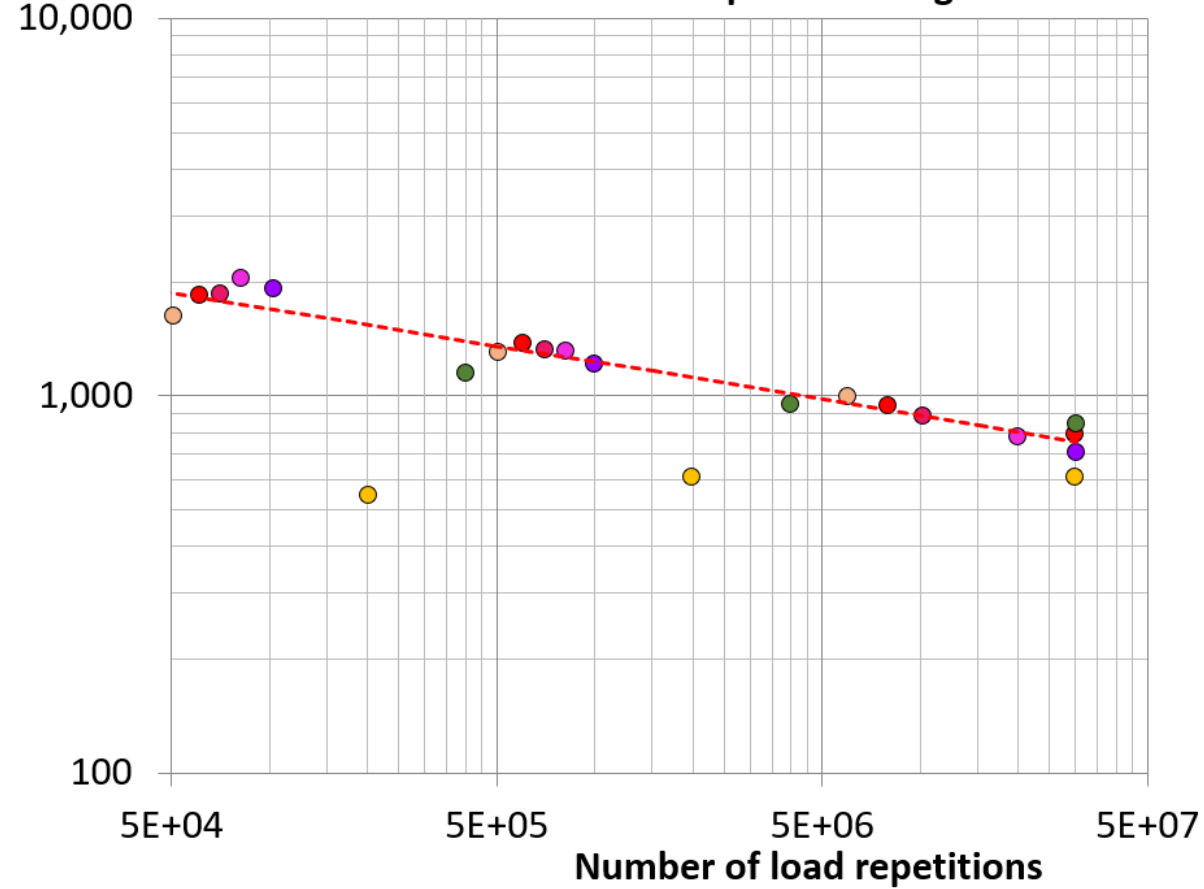

Our Carbon Equation

Many models based on limited data

22 data points

Permissible Vertical Microstrain at the Top of the Subgrade

Original data used to derive **AUSTROADS** subgrade strain criterion (Youdale 1984)

- CBR=2
- CBR=3
- CBR=4
- CBR=5
- CBR=7
- CBR=10
- CBR=20
- Eqn 1

Standards based on data from 30-80 years ago.

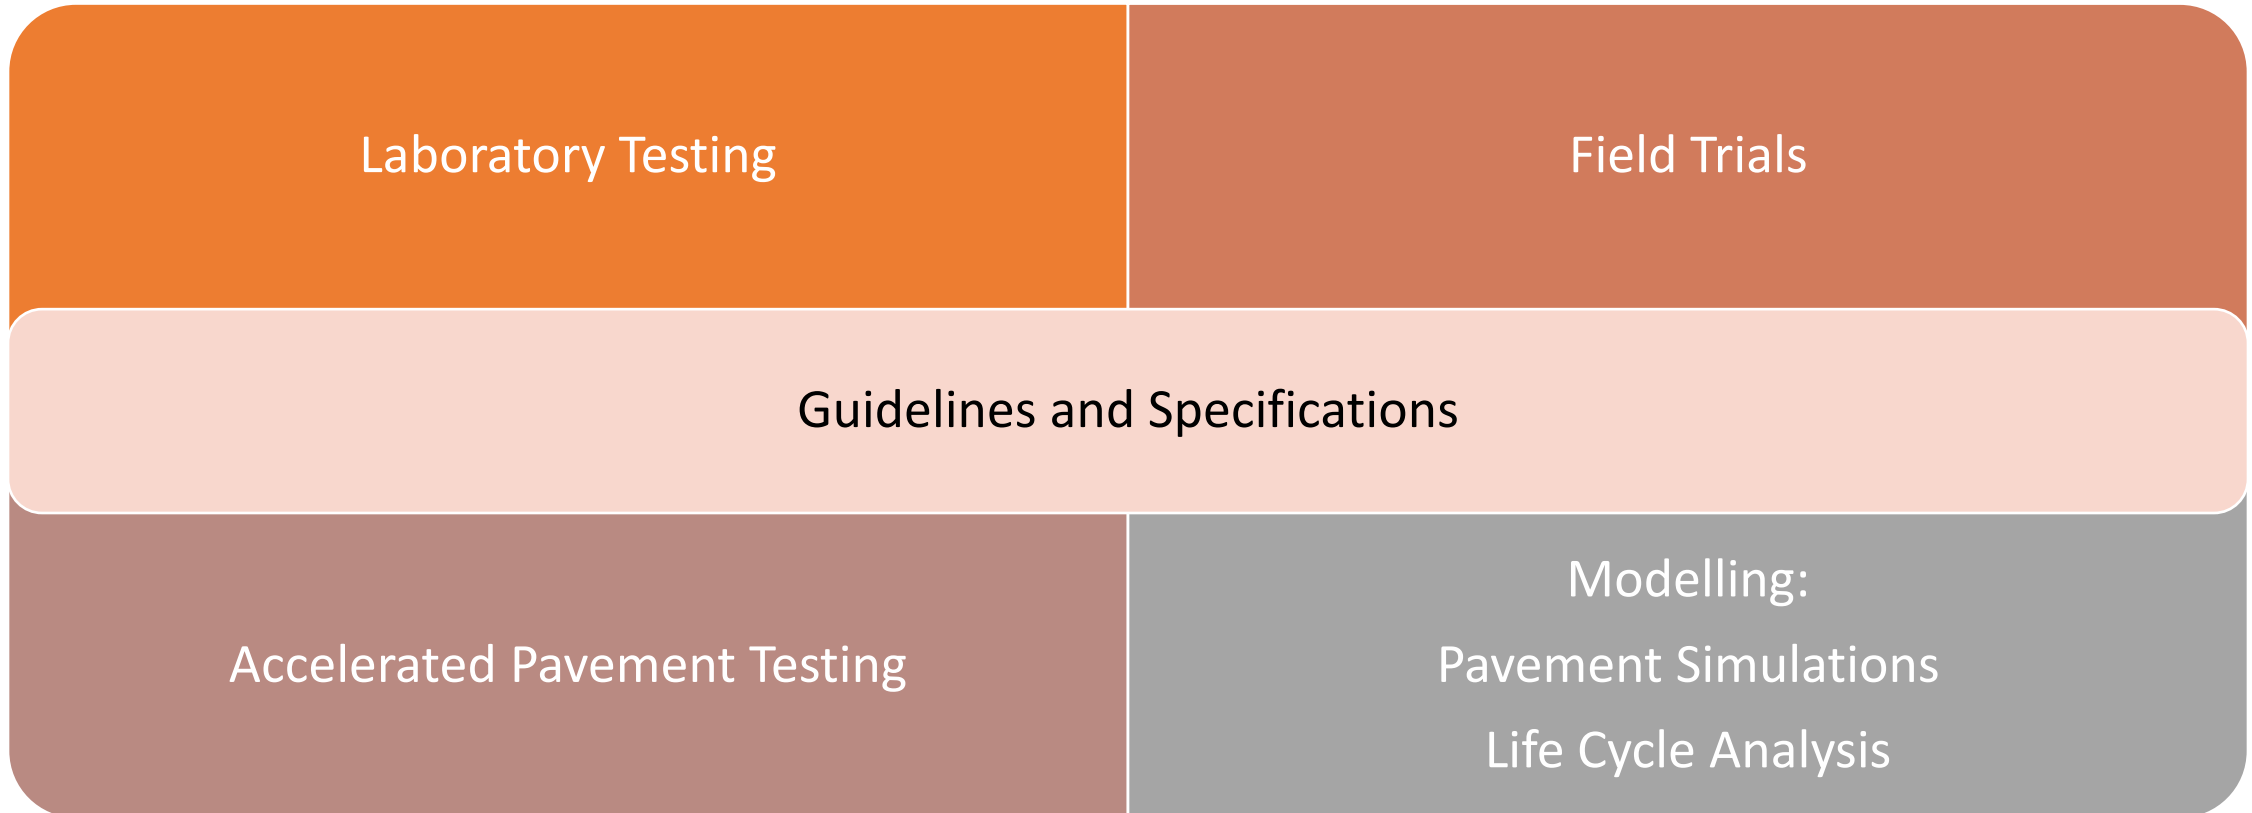

- Axle loads
- Traffic volume
- Material properties
- Created locally applied globally
- Inevitably fail to produce designs optimizing life cycle cost.

Expected life varies geographically and is sensitive to:

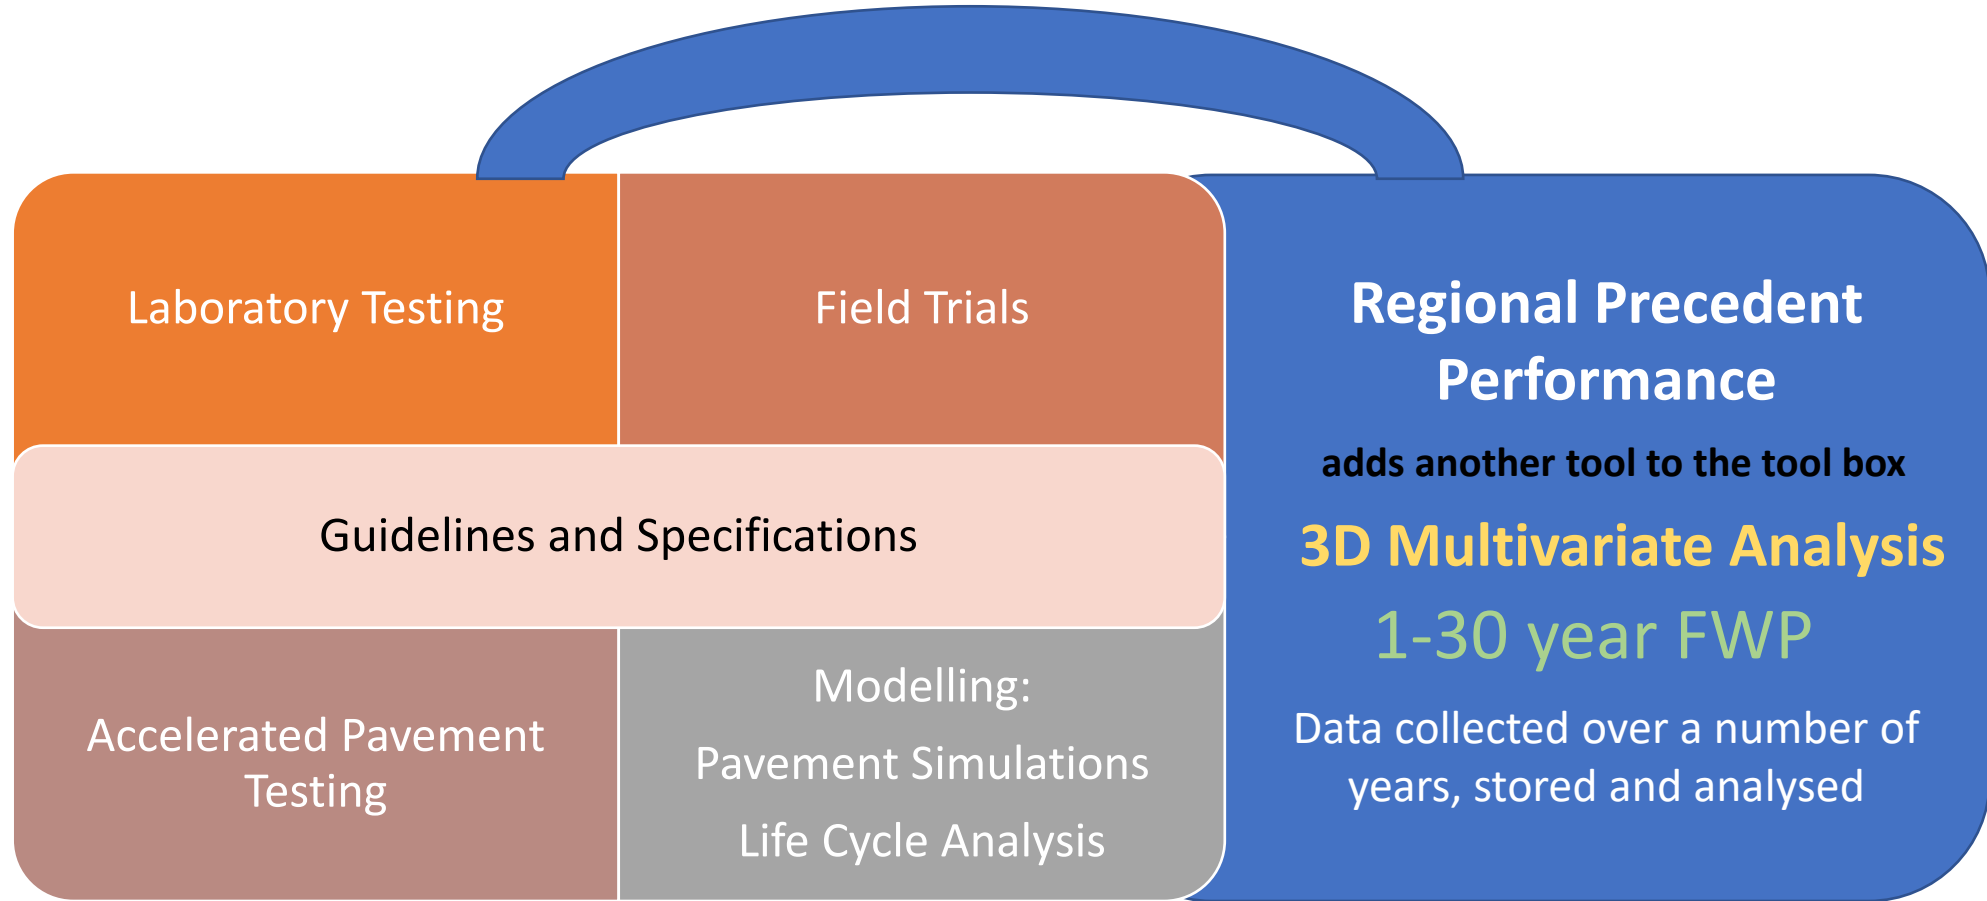

- Environmental factors
- Quality of construction:
- Layer thickness & compaction
- Maintenance Practices
- Quality of natural and imported materials
- Quality assurance is based on a few samples only

EXISTING PAVEMENTS MODELS

The current integrated research approach

An Integrated Research Approach - huge data sets

Regional Precedent Performance (RPP)

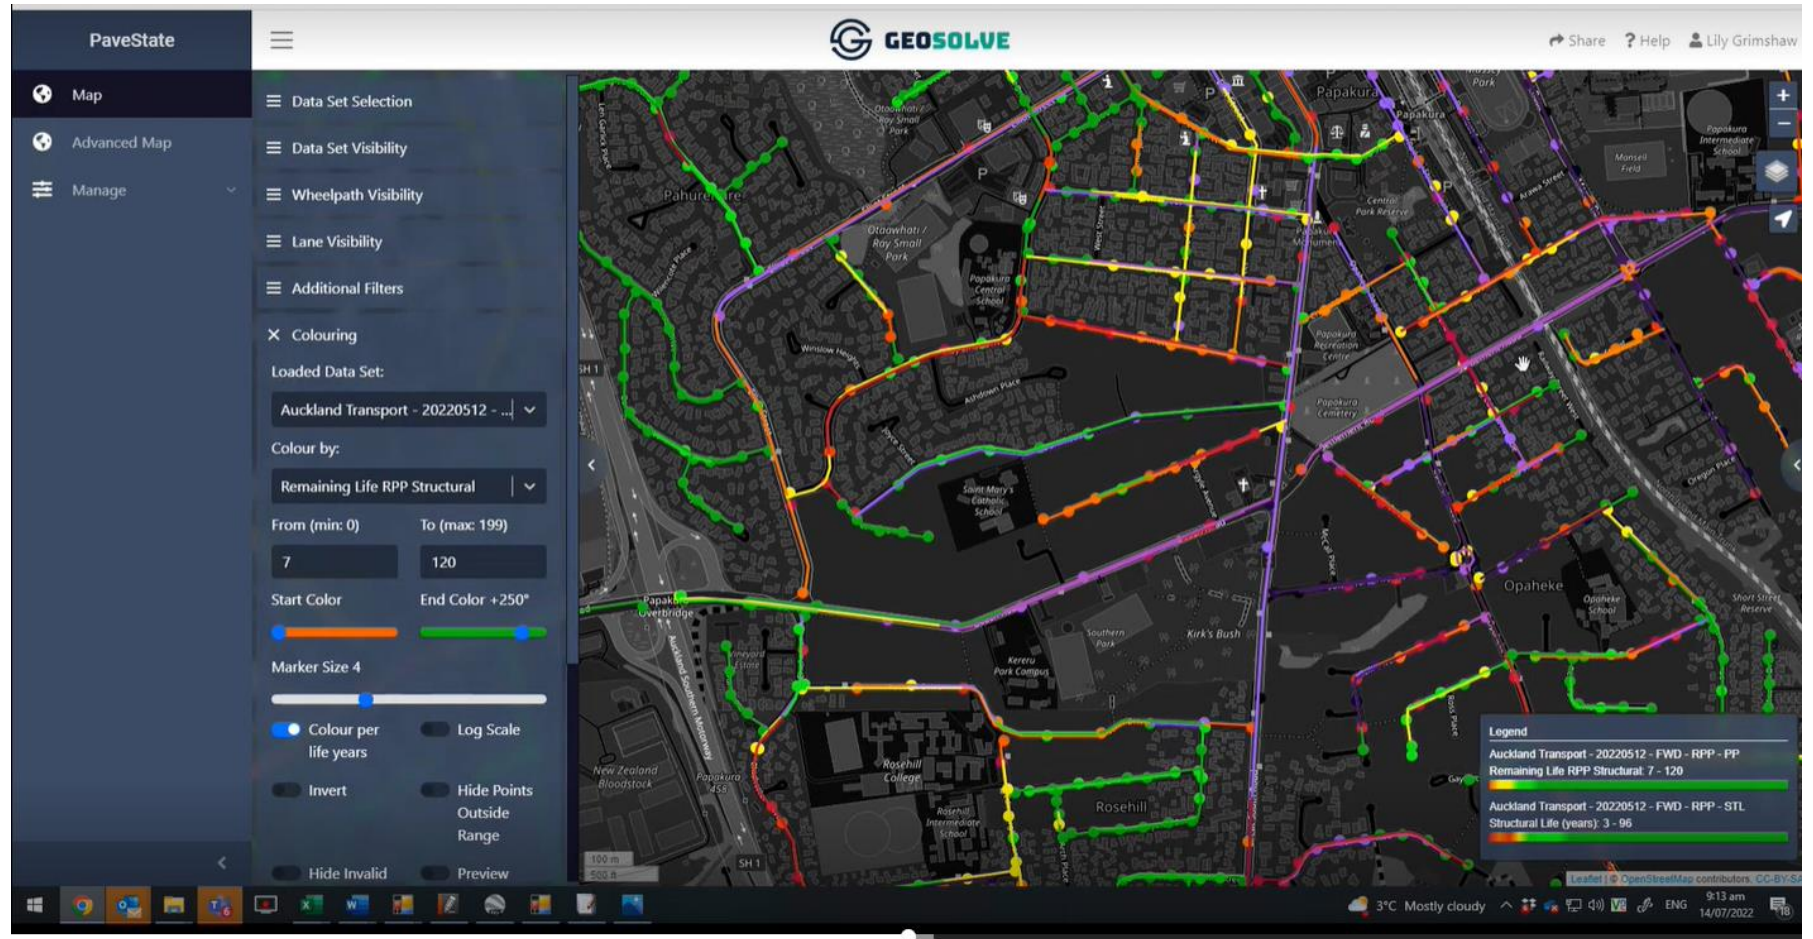

Huge Data Sets

3D Multi-Variate Analysis

- 20+ distress modes including:
 - Susceptibility of each STL to Overloaded axles (Risk of damage)
 - Subsurface Drainage Priorities
- Region specific models
- Structural life for each STL and a suite of generic design solutions & costs
- Long Term & Short Term Mechanistic Forward Work Programmes

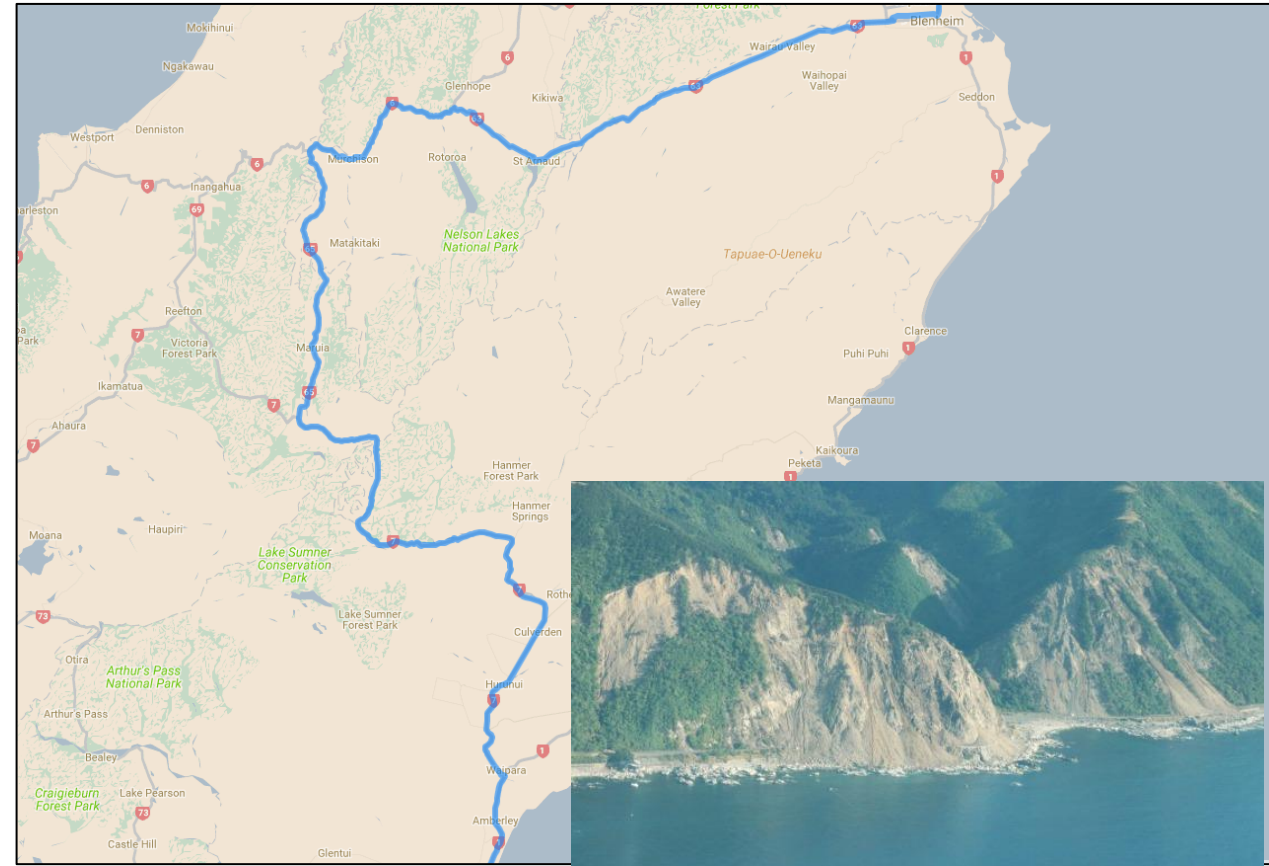

Structural Treatment Length

- Failure mode
- Remaining MESA
- Optimum rehabilitation & time of maintenance /rehab

Kaikoura Bypass Case History

- Kaikoura earthquake 11/11/2016
- Needed bypass route
- Original 25-Year Traffic will be experienced by mid next year on northern section (SH 63)
- The ultimate “Reality Check” of life prediction models: Real traffic on real roads with a range of real environments.

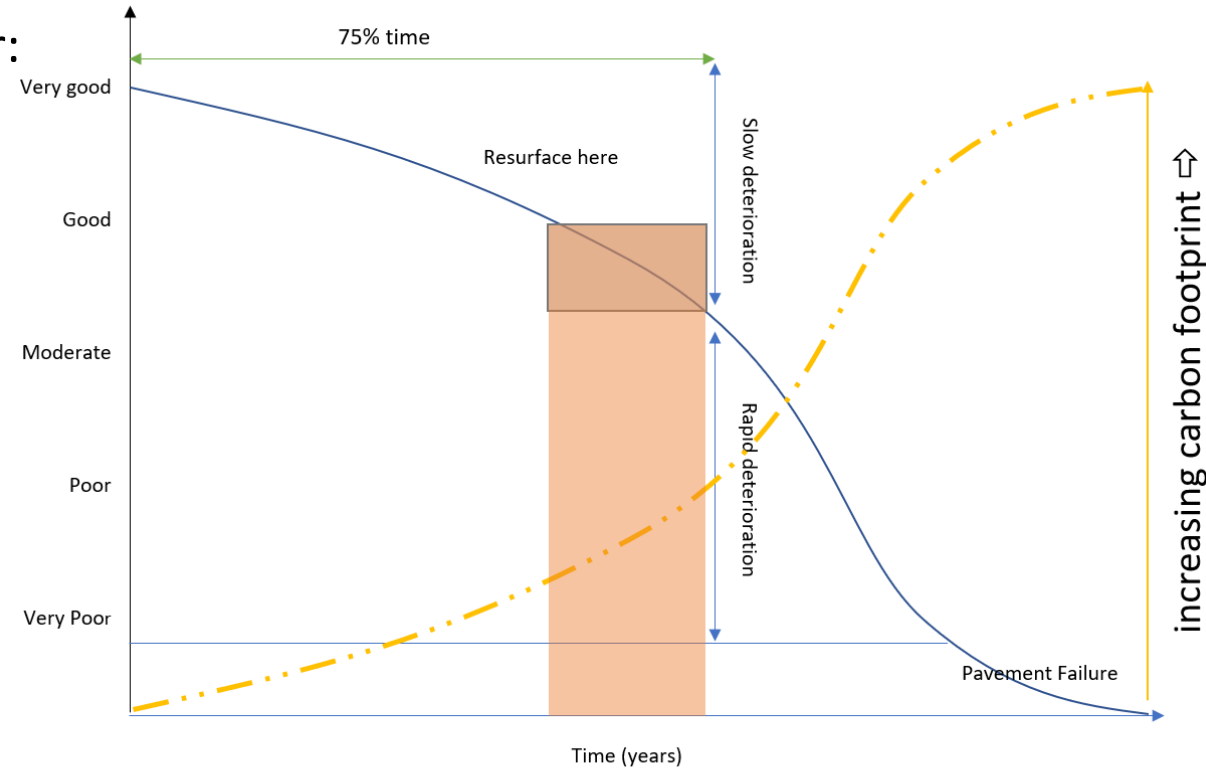

SO, To Maintain or Rehabilitate?

Both are necessary

High speed structural data provides critical information for:

- Improvement of models
- Structural information
- Visual and functional data
 - Short term FWP
 - Help refine time for intervention
 - Identify localised pavement failure, pot holes etc
- Together:
 - Improve models
 - Define STL
 - Provide short term and long term maintenance & management of pavements

Save money and reduce the carbon and environmental footprint
